

QUESTION

Should Low FiO2 vs. High FiO2 be used for Term Neonatal Resuscitation?	
POPULATION:	Term Neonatal Resuscitation
INTERVENTION:	Low FiO2
COMPARISON:	High FiO2
MAIN OUTCOMES:	Mortality - Short-term Mortality; Neurodevelopmental Impairment - Long-Term NDI (1-3 Years); Hypoxic-Ischemic Encephalopathy (Sarnat Grade II/III) - HIE (Grade II/III);
SETTING:	Delivery Room
PERSPECTIVE:	Patient
BACKGROUND:	The last ILCOR analysis of initial oxygen use for term neonatal resuscitation was completed in 2010 before the adoption of the GRADE methodology for ILCOR reviews. The question of the what oxygen concentration to start resuscitation following birth impacts an enormous number of lives worldwide each year.
CONFLICT OF INTERESTS:	None

ASSESSMENT

Undesirable Effects												
How substantial are the undesirable anticipated effects?

Certainty of evidence

What is the overall certainty of the evidence of effects?

JUDGEMENT

- Very low
- Low
- Moderate
- High
- No included studies

RESEARCH EVIDENCE

From the GRADE evidence table, our certainty is low for our primary outcome of mortality and secondary outcome of HIE. Our certainty is very low for the outcome of long term NDI.

Outcomes	Relative effect (95% CI)	Anticipated absolute effects* (95% CI)			Certainty of the evidence (GRADE)	What happens
		Without Low FiO2	With Low FiO2	Difference		
Mortality - Short-term Mortality Nº of participants: 1469 (7 RCTs)	RR 0.73 (0.57 to 0.94)	Study population			⊕⊕○○ LOW ^{a,b,c}	
		17.0%	12.4% (9.7 to 15.9)	4.6% fewer (7.3 fewer to 1 fewer)		
Neurodevelopmental Impairment - Long-Term NDI (1-3 Years) Nº of participants: 360 (2 RCTs)	RR 1.41 (0.77 to 2.60)	Study population			⊕○○○ VERY LOW ^{d,e,f}	
		8.9%	12.5% (6.8 to 23.0)	3.6% more (2 fewer to 14.2 more)		

ADDITIONAL CONSIDERATIONS

The task force considered the certainty of evidence to be low due to methodologic problems such as lack of allocation concealment, lack of blinding and risk of publication bias as well as insufficient numbers studied to reach optimal sample size. Also the studies were done in populations or settings in which pulse oximetry and titration were not available and may not be generalizable to all settings.

Hypoxic-Ischemic Encephalopathy (Sarnat Grade II/III) - HIE (Grade II/III) N ^o of participants: 1359 (5 RCTs)	RR 0.90 (0.71 to 1.14)	Study population			⊕⊕○○ LOW ^{g,h,i}
		19.6%	17.7% (13.9 to 22.4)	2.0% fewer (5.7 fewer to 2.7 more)	

- a. Five out of seven studies have a high risk of "Allocation sequence", "Allocation concealment", and "Blinding". These domains may influence the outcome.
- b. Total number of patients (1469) include in the SR was less than OIS (2146).
- c. The funnel plot was not symmetric. This would be an indication for publication bias.
- d. The funnel plot was not symmetric. This would be an indication for publication bias.
- e. 95% CI of RR included both benefit and harm (RR of under 0.75 or over 1.25 as a rough guide) would downgrade.
- f. Both studies have high risk of "Allocation sequence", "Allocation concealment", and "Blinding". NDI should be ideally assessed by a blinded assessor but "Blinding of data collectors" was unclear. And the follow-up rate (Saugstad 2003) was extremely low (only approximately 2/3 of patients).
- g. All studies have the high risk of "Allocation concealment" and "Blinding" affecting the outcome.
- h. 95% CI includes 1,0 (absolute effect) although CI relatively narrow.
- i. The funnel plot was not symmetric. This would be an indication for publication bias.

Values

Is there important uncertainty about or variability in how much people value the main outcomes?

JUDGEMENT	RESEARCH EVIDENCE	ADDITIONAL CONSIDERATIONS
<ul style="list-style-type: none"> ○ Important uncertainty or variability ○ Possibly important uncertainty or variability ● Probably no important uncertainty or variability ○ No important uncertainty or variability 	<p>Strand M, Simon W, Wyllie J, Wyckoff M, Weiner G. CONCLUSIONS

Recommendation

For term and late preterm newborns (≥ 35 weeks gestation) receiving respiratory support at birth, we **suggest** starting with 21% oxygen (**weak** recommendation, low certainty evidence). We **recommend against** starting with 100% oxygen (**strong** recommendation, low certainty evidence).

Justification

Parents and clinicians rate mortality as a critical outcome. Despite low certainty of the evidence, the large reduction in the primary outcome of short term mortality (NNT=22) with no demonstrated adverse effects favors use of 21% oxygen as the initial gas for resuscitation in term and late preterm newborns. Although there are no published cost data, it is likely that initiating resuscitation with 21% oxygen does not add cost and might result in cost savings compared to initial 100% oxygen in some settings. Babies born in low resource settings are disadvantaged by increased mortality and morbidity. Therefore, it is plausible that using 21% oxygen compared to 100% oxygen has greater impact in low resource settings. Use of 21% oxygen for initial resuscitation is universally feasible and is now accepted by the neonatal community world-wide.

Subgroup considerations

Relatively few late preterm (35-36 week gestation) infants were included in the studies. The confidence in our recommendations for this gestational age group is low.

Implementation considerations

21% oxygen is available everywhere. Where resources permit, compressed air and oxygen source, blender and pulse oximeter should be available to guide adjustments in oxygen concentration

Monitoring and evaluation

Whenever an intervention that impacts critical outcomes is introduced, monitoring of process and outcomes is encouraged.

Research priorities

KNOWLEDGE GAPS

There were relatively few late preterm (35-36 week gestation) infants in the studies. The confidence in our recommendations for this gestational age group is low. More studies are needed regarding this population

Does titration of oxygen to SpO₂ targets impact conclusions?

Need data comparing intermediate oxygen concentrations

Does delayed cord clamping have any effect on the impact of oxygen exposure?
